

All ovens have a Porcelain Coating.
Porcelain is glass.
Thickness is around 5 mills or 0.005".

Subject:

I'm doing a little research on cooking\baking ovens, I was wondering if you can help out a little.
its my understanding that most ovens have an enamel coating, I was wondering what the enamel coating is made out of, porcelain or metal or glass or a combination and if so what percent of each. also I was wondering how thick is the layer of enamel on a standard oven/

Thank You

Kenneth Schuster
